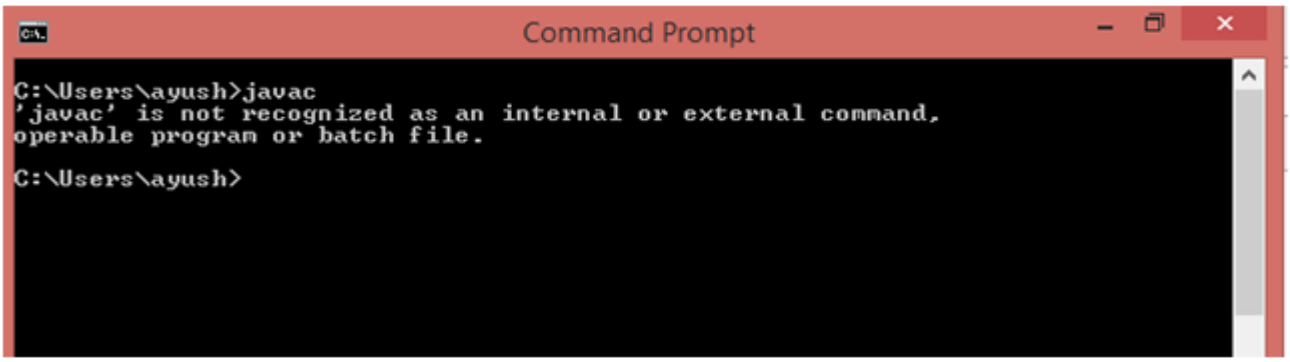
Experiment 01(a) – Installation Steps of JAVA

Learning Objectives: To understand the method of installing and configuring JAVA and testing the same with the help of a simple program.

Theory:

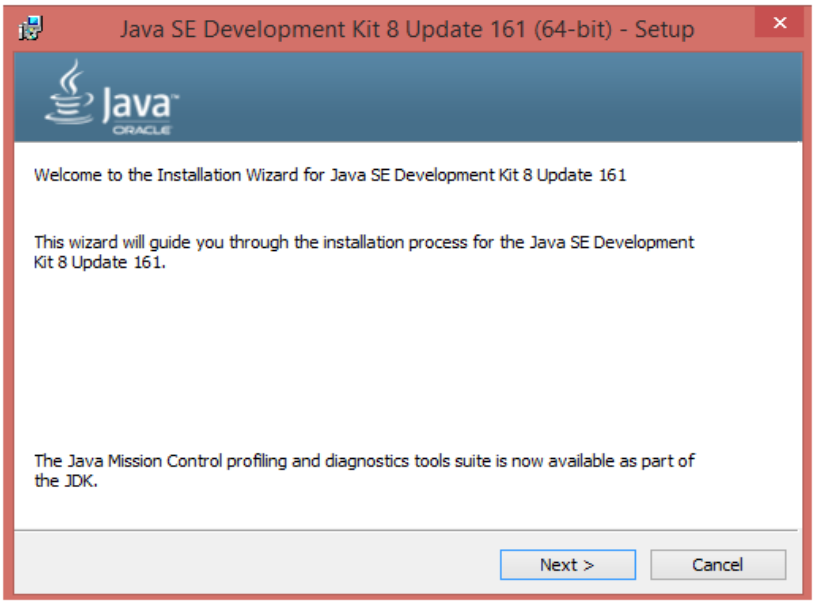
Step 1: Verify that it is already installed or not

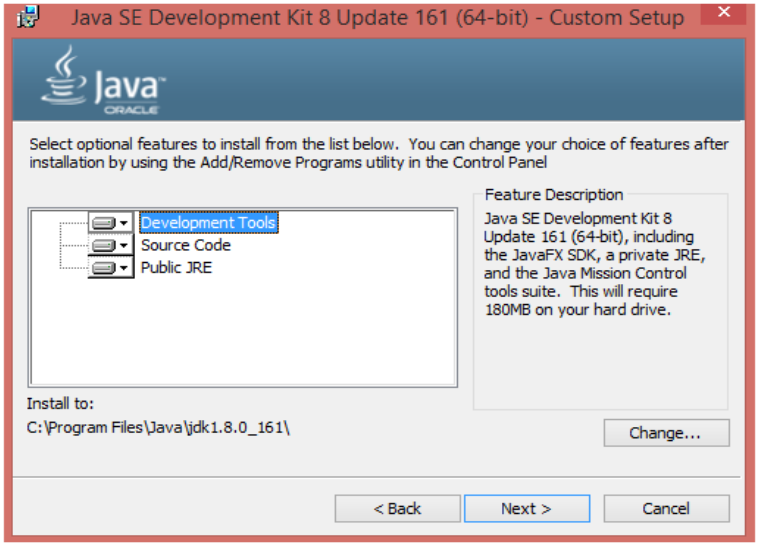
Check whether Java is already installed on the system or not.



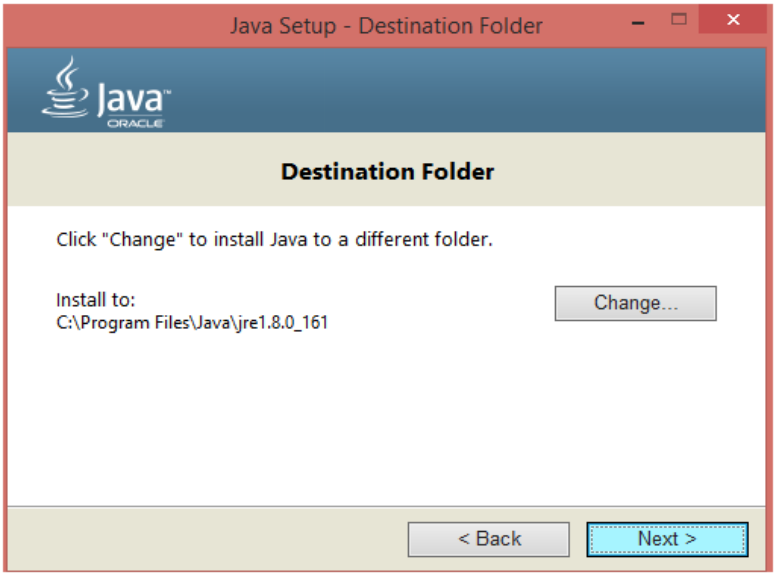
Step 2: Download and Install JDK.

Open the executable file which you have just downloaded and follow the steps.





Step 3: Just Choose Development Tools and click Next.

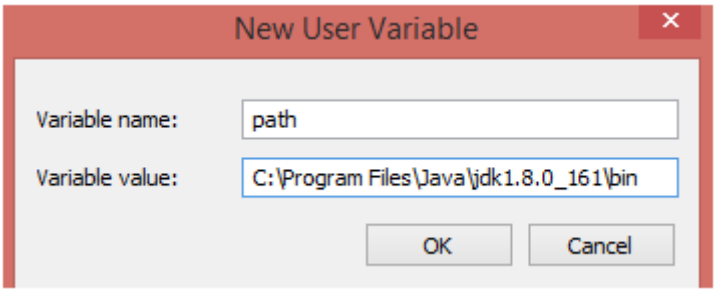


Step 4 : Set the Permanent Path
To execute Java applications from the command line, we need to set Java Path. To set the path, follow the following steps**.**

Right click on "this PC". It can be named as "My Computer" in some systems. Choose "properties" from the options.

Click on "Advanced system settings" to continue.

Click on "Environment Variables" to continue.



Enter "path" in variable name and enter the path to the bin folder inside your JDK in the variable value. Click OK.

Now Java Path has been set up. Open the Command prompt and type "javac" In case you have already open up the command prompt, I suggest you close the existing window and reopen it again.

HELLO WORLD PROGRAM:

OUTPUT:

Program to take user input (Scanner class)

Found in the java.util package, Java's Scanner class can read input from the command line and return it as a String, BigDecimal or any one of Java's eight primitive types.

PROGRAM:

OUTPUT:

Learning Outcomes: Students will able to

LO1.1 Understand the steps to download and configure java.
LO1.2 Remember and recall different features of java.
LO1.3 Differentiate between Procedural and Object-Oriented Programming Language.

Course Outcome:
CO1: Understand about Object Oriented Programming.

Conclusion:

Viva Questions:

1. What is byte code and class file?

2. What is JVM?

3. What is meant by object-oriented programming?
